

BadiliX

Solana for Dumb Phones

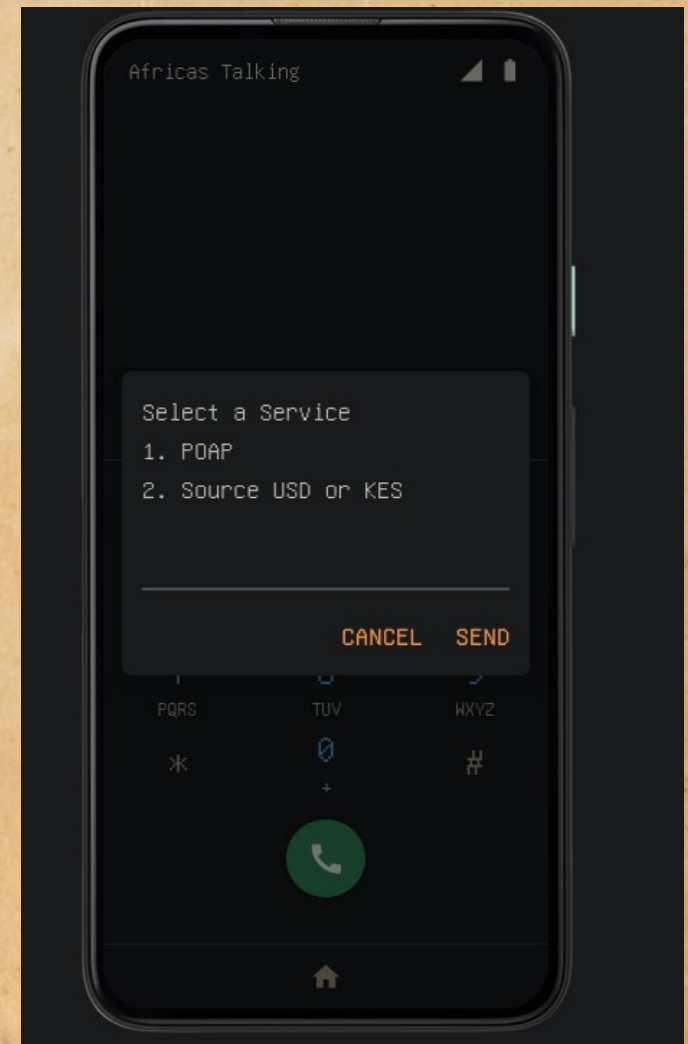

Problem

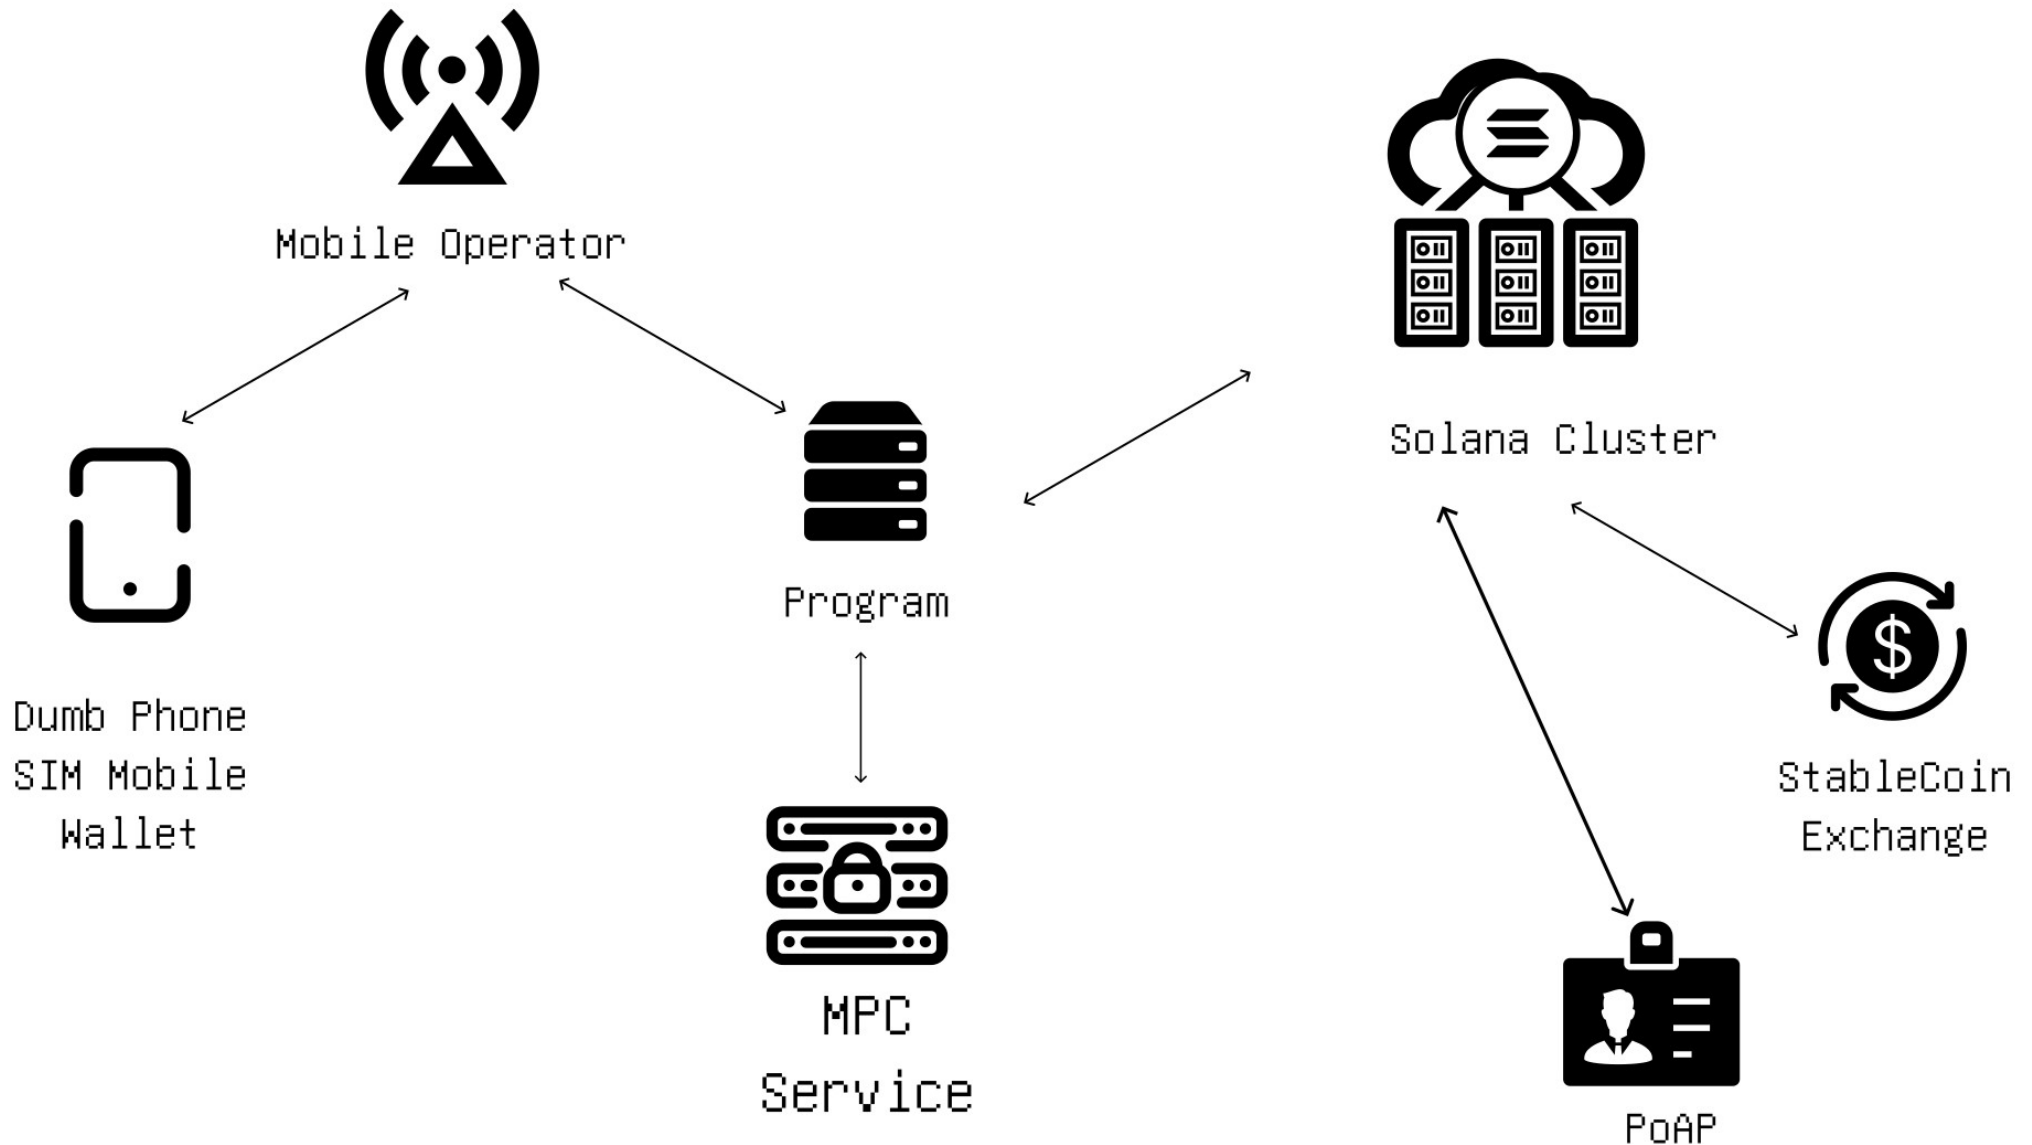

- Solana wallets connect only smartphone users to the blockchain leaving out millions of users who use dumb phones.
 - Even users of dumb phones need financial freedom at the speed of light :)
- 

Solution

- USSD is a service that acts as an intermediary between a dumb phone and a software program using a telecom provider as the intermediary
- The dumb phone does not need internet, just the SIM card. Even a 2G network will do.

Network relay structure

BadiliX – Onboard millions more to Solana.
